Task 2: Email Validation for a User Registration System

Scenario

You are developing the backend of a user registration system. One requirement is to validate user email addresses before storing them in the database.

Task Description

Apply **Test Driven Development** by:

1. Writing unit test cases that define valid and invalid email formats (e.g., missing @, missing domain, incorrect structure).
2. Using **AI assistance** to implement the validate_email() function based strictly on the behavior described by the test cases.

The implementation should be driven entirely by the test expectations.

Expected Outcome

- Well-defined unit tests using unittest or pytest
- An AI-generated email validation function
- All test cases passing successfully
- Clear alignment between test cases and function behavior

```

Task 3: Decision Logic Development Using TDD

Scenario

In a grading or evaluation module, a function is required to determine the maximum value among three inputs. Accuracy is essential, as incorrect results could affect downstream decision logic.

Task Description

Using the **TDD methodology**:

1. Write test cases that describe the expected output for different combinations of three numbers.
2. Prompt **GitHub Copilot or Cursor AI** to implement the function logic based on the written tests.

Avoid writing any logic before test cases are completed.

Expected Outcome

- Comprehensive test cases covering normal and edge cases
- AI-generated function implementation
- Passing test results demonstrating correctness
- Evidence that logic was derived from tests, not assumptions

Task 4: Shopping Cart Development with AI-Assisted TDD

Scenario

You are building a simple shopping cart module for an e-commerce application. The cart must support adding items, removing items, and calculating the total price accurately.

Task Description

Follow a **test-driven approach**:

1. Write unit tests for each required behavior:
 - Adding an item
 - Removing an item
 - Calculating the total price
2. After defining all tests, use **AI tools** to generate the ShoppingCart class and its methods so that the tests pass.

Focus on behavior-driven testing rather than implementation details.

Expected Outcome

- Unit tests defining expected shopping cart behavior
- AI-generated class implementation
- All tests passing successfully
- Clear demonstration of TDD applied to a class-based design

```

AAC A 7.3.py AAC A 8.4.py X

Task 5: String Validation Module Using TDD

Scenario

You are working on a text-processing module where a function is required to identify whether a given string is a palindrome. The function must handle different cases and inputs reliably.

Task Description

Using Test Driven Development:

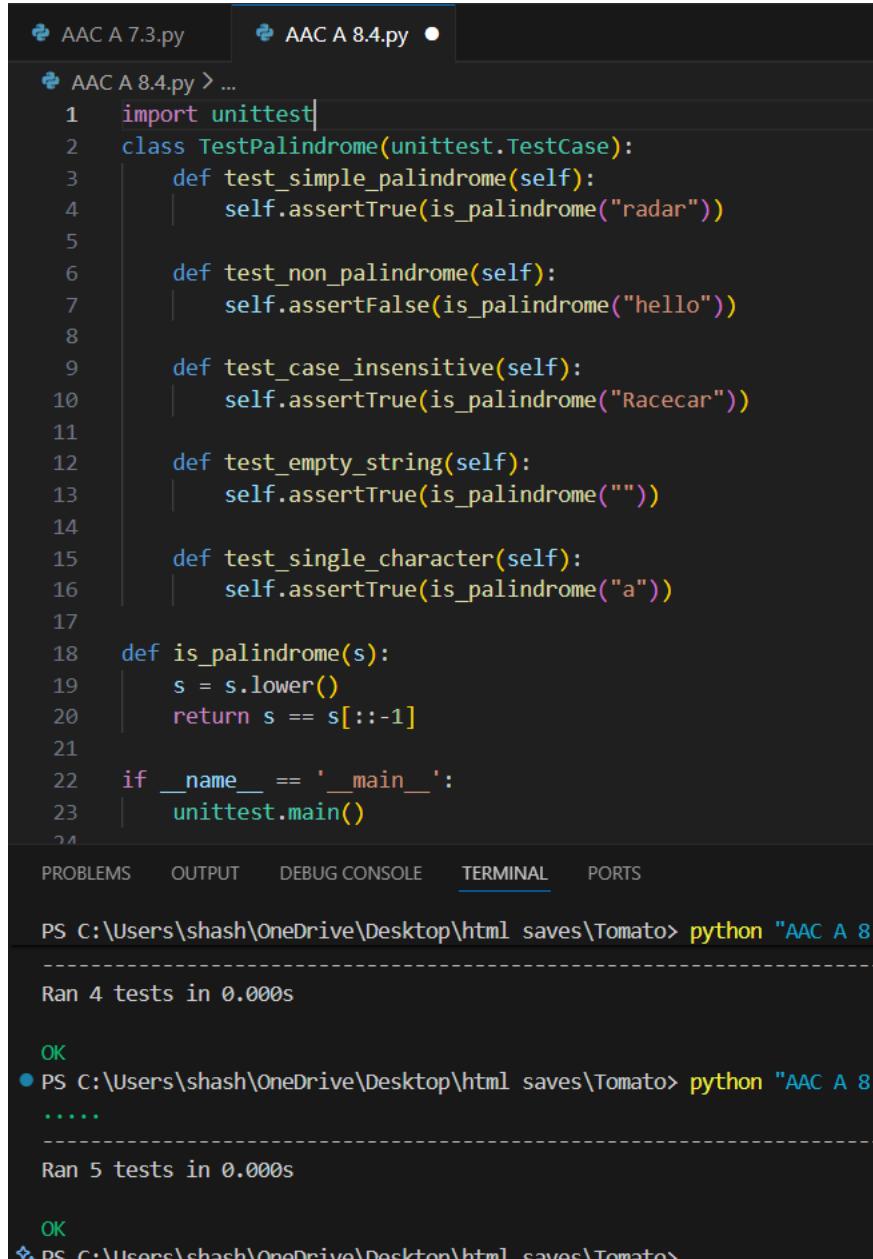

1. Write test cases for a palindrome checker covering:
 - Simple palindromes
 - Non-palindromes
 - Case variations
2. Use **GitHub Copilot or Cursor AI** to generate the `is_palindrome()` function based on the test case expectations.

The function should be implemented only after tests are written.

Expected Outcome

- Clearly written test cases defining expected behavior

- AI-assisted implementation of the palindrome checker
- All test cases passing successfully
- Evidence of TDD methodology applied correctly

The screenshot shows a code editor interface with a dark theme. At the top, there are tabs for 'AAC A 7.3.py' and 'AAC A 8.4.py'. The 'AAC A 8.4.py' tab is active, showing the following Python code:

```

1 import unittest
2 class TestPalindrome(unittest.TestCase):
3     def test_simple_palindrome(self):
4         self.assertTrue(is_palindrome("radar"))
5
6     def test_non_palindrome(self):
7         self.assertFalse(is_palindrome("hello"))
8
9     def test_case_insensitive(self):
10        self.assertTrue(is_palindrome("Racecar"))
11
12    def test_empty_string(self):
13        self.assertTrue(is_palindrome(""))
14
15    def test_single_character(self):
16        self.assertTrue(is_palindrome("a"))
17
18    def is_palindrome(s):
19        s = s.lower()
20        return s == s[::-1]
21
22 if __name__ == '__main__':
23     unittest.main()

```

Below the code editor, there is a navigation bar with tabs: PROBLEMS, OUTPUT, DEBUG CONSOLE, TERMINAL (which is underlined), and PORTS.

The terminal window displays the following output:

```

PS C:\Users\shash\OneDrive\Desktop\html saves\Tomato> python "AAC A 8.
